

Meet Jain

[LinkedIn](#) • [GitHub](#) • meetjain@gmail.com • [Portfolio](#)

Product infrastructure engineer specializing in **financial protocols, onchain systems, and backend architecture** at the founding layer. Architected the technical showcase for a **NASDAQ acquisition**; currently co-founding a **prediction market lending protocol**

WORK EXPERIENCE

Revalon Finance | Co-founder & CTO

April 2026 - Present

Remote

- Architected a **production-grade floor-aware lending protocol** on Polygon PoS — 5 Solidity contracts, 7-guard on-chain quote verification, 48h TimelockController, and 3-of-5 Gnosis Safe multisig — achieving zero bad debt across full testnet lifecycle
- Built a **dynamic LTV underwriting engine in Go** computing per-condition borrow rates (60–90%) via 7 real-time market signal multipliers (time-to-expiry, implied probability, liquidity tier, bid-ask spread, cross-platform deviation, oracle objectivity) with full PostgreSQL audit trails for ML training
- Engineered a **two-sided lending marketplace** with a rebasing rUSDC receipt token, utilisation-zone APY controls (6–15%), and a Go drift monitor goroutine tracking 5 collateral health metrics per loan with a 3-tier automated margin call system
- Integrated **Polymarket** (trustless ERC-1155 on-chain custody) and **Kalshi** (CFTC-regulated API attestation) as dual off-chain collateral sources with AES-256 + KMS envelope encryption and sub-account position isolation
- Shipped a pnpm monorepo (Go Gin, Next.js 16, Solidity) with **AWS KMS policy signing**, OZ Defender keeper automation, and a **7-layer security architecture** including CEI enforcement, flash-loan resistance via off-chain snapshot signing, and real-time vault reconciliation

MetaKeep (Acquired) | Senior Software Engineer

April 2025 - May 2026

San Francisco, Remote

- Engineered the **end-to-end crypto payment integration** that served as the primary technical validator for MetaKeep's **acquisition** by **Rezolve AI (NASDAQ: RZLV)**, March 2026 — built on Reown Wallet Mobile Kit and MetaKeep SDK, enabling sign-up-free transactions inside a chatbot UI for luxury retail
- Led **Wallet Isolation**, an enterprise security feature enforcing per-app key segregation — **reduced pre-production bugs by 40%** and shipped as a production-ready feature adopted across the MetaKeep SDK
- Built MetaKeep's **crypto onramp from zero to production** — integrated Coinbase API and MetaKeep SDK to enable zero-fee, sign-up-free purchases; architected a MoonPay fiat-to-token rail chaining card purchases through Jupiter swaps with auto-deposit into MetaKeep wallets
- Designed an **on-chain USDC transfer system** using SPL token delegation, eliminating repeated approval flows and reducing transaction friction for end users
- Shipped 8 SDK integration demos (6 Android, 2 iOS) covering Solana and Ethereum transaction flows — used as developer documentation and sales tooling for enterprise partners

Quranium L1 | Blockchain Developer Intern

Oct 2024 – Mar 2025

- Built an MVP decentralized exchange using Uniswap v3 and a multi-signature wallet for a quantum-resistant L1
- **Open source:** Contributed 4 merged PRs to FairFund smart contracts, reducing gas costs by 25%, fixing critical bugs, and increasing test coverage to 100%

TECHNICAL SKILLS

Systems & Protocols: Go, Rust, Solidity, PostgreSQL, Redis, AWS Nitro Enclaves

Application Layer: TypeScript, Next.js, React, Node.js, Prisma, MongoDB

Infrastructure: Docker, Terraform, Linux, CI/CD, EC2, AWS KMS

EDUCATION

JECRC University

Graduated

Bachelor's Degree in Computer Science
